

Abstract of the Invention

A method and system of tracing an agricultural product relates to recording of at least one of planting information, growing information, harvesting information, chemical information, and weather information (e.g., electronically recorded) concerning a crop to form a data profile for a corresponding crop. Once harvested, the crop is segregated from intermixing with other harvested crops by placing the crop in one or more containers, each having a corresponding identifier. The data profile is associated with the container profile for later referencing of the data profile.
